

a second portion including at least one electronic component, each of said first and second portions including a protruding tab segment;
hinge means pivotally connecting said first and second portions;
a movable member movably positioned on at least part of each of said first and second portions and including first and second openings therein, said movable member movably positioned on said tab segments of said first and second portions and adapted for independent movement with respect to said first and second portions and said hinge means during pivotal movement of at least one of said portions, said movable member being a separate member from said hinge means; and
a flexible cable for electrically interconnecting said electronic component of said first portion with said electronic component of said second portion, said flexible cable passing through said first and second openings of said movable member and engaging said movable member during said pivotal move-

ment of said at least one of said portions to effect movement of said movable member.

2. The invention according to claim 1 wherein said electronic apparatus is a portable computer.

3. The electronic apparatus according to claim 2 wherein said electronic component of said first portion comprises a keyboard.

4. The electronic apparatus according to claim 3 wherein said electronic component of said second portion comprises a display.

5. The electronic apparatus according to claim 1 wherein said movable member includes longitudinal sides and is of substantially cylindrical configuration, each of said first and second openings being positioned along a respective one of said longitudinal sides of said movable member.

6. The electronic apparatus according to claim 1 wherein said flexible cable is of substantially flat configuration.
